

The Earth System Complexity group at AWI is focused on understanding interactions between large-scale components of the Earth, like the ice sheets and ocean circulation, boreal forest and permafrost. We strive to increase our understanding of the relevant processes driving dynamics within these systems on long timescales, using numerical models and paleo data analysis.

Group members

Alexander Robinson	Javier Blasco
Britta Grusdt	Nils Bochow
Mahé Perrette	Raphael Hebert
Anna Höse	

Projects

FORCLIMA – Forecasting climate surprises on long timescales

ClimTip - Understanding and Assessing Climate Tipping Points

P2F – Past to Future
